

What is oak wilt?

Kama Ross, District Forester

- Non-native invasive fungus
- Affects oak trees
- 100% fatal for red oak group
- By the time the trees wilt, they are dead – no treatment after infection

What are the current and potential impacts?

- **Oak comprises ~10% of the forest volume in Michigan**
- **Oak wilt has been in Northern Michigan for many decades, 1980s**
- **Grand Traverse County continues to have the most new confirmed sites in Michigan**
- **Loss of timber value and wildlife benefits**
- **Aesthetic value/property values**
- **Loss of diversity of tree species in our forests**
- **Expense of treatment/control and tree removals**

Identification of oak wilt

- From mid-summer to early fall, oak leaves wilt and **FALL OFF TREE** in just weeks, typically less than a month
- Trees that have recently wilted will eventually produce fungal spore mats under the bark
- Confirmation of presence of the fungus is required

How does it spread?

Spreads above ground from nitidulid (sap/picnic) beetles that are attracted to fungal spore mats and wounds on tree

Spreads belowground via root grafts from infected trees to healthy trees

Oak Wilt Can Be Controlled...

- Don't prune, injure or remove red oaks during growing season, April to November for landowners near confirmed oak wilt sites
- Talk with your neighbors who have red oak trees
- Confirm with tree care professional
- Report confirmation to FAP or DNR
- Follow treatment plan
- Oak Wilt is not going away but we can control it's spread with
- Education, Education, Education....
- Ongoing discussion with state regulators- MDARD/DNR.
- Leelanau County Board of Commissioners support of educational efforts with all residents, visitors, tree services, landscapers, realtors, excavators, construction...
